

In view of the health context linked to the spread of the coronavirus, the methods of organisation and evaluation of the learning units could be adapted in different situations; these possible new methods have been - or will be - communicated by the teachers to the students.

Q1

Teacher(s)	Pereira Olivier ;
Language :	English
Place of the course	Louvain-la-Neuve
Aims	<i>The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit".</i>
Evaluation methods	Due to the COVID-19 crisis, the information in this section is particularly likely to change. The evaluation is based on a written examination. Answers can be provided in English or in French.
Teaching methods	Due to the COVID-19 crisis, the information in this section is particularly likely to change. The class is organised around lectures and exercise sessions. A specific attention is placed on the links between the theoretical concepts introduced in the class and the practical applications of cryptography.
Content	<p>We introduce the core concepts of modern cryptography, with a specific focus on the mathematical and algorithmic aspects. Historical problems and constructions will be discussed and serve as a basis for the introduction of the core security notions and cryptographic mechanisms that are in use to day, as well as for the development of methods for justifying the security of these mechanisms. The contents may include:</p> <ul style="list-style-type: none"> • Information theoretic cryptography, perfect encryption. • Probabilistic algorithms, computational security, attacker models, elaboration of security proofs in cryptography. • Symmetric encryption: security definitions, basis constructions, block ciphers (AES, DES), cryptanalysis, operation modes. • Authentication codes, hash functions. • Asymmetric cryptography: Diffie-Hellman protocol, public key encryption (ElGamal, RSA, ...), signature (Schnorr, DSA/DSS, RSA hash-and-sign, ...), public key infrastructures. • Basic algorithmic number theory (modular arithmetic, primality testing, elliptic curves) • Protocols: challenge-response, identification, authentication, zero-knowledge • Standards and norms: discussion, practical concerns, <p>The balance between the various parts can vary from one year to another.</p>
