|---------------------|--|--|--|--|--|--|
| Language : | English > French-friendly | | | | | |
| Place of the course | Louvain-la-Neuve | | | | | |
| Main themes | The teaching will cover the following topics: defects in inorganic solids and their formation mechanisms. description of the chemical bond in inorganic solids (band theory) description of electrical properties (conductors, semi-conductors, superconductors), magnetic, optical and photophysical properties of principal inorganic solids, and the current applications in the growing domain of functional materials. | | | | | |
| Learning outcomes | At the end of this learning unit, the student is able to : | | | | | |
| , j | This course is directed to students having a basic formation in inorganic chemistry and aiming to complete their formation by advanced notions in physical chemistry of functional inorganic materials. | | | | | |
| | It aims at giving a fundamental understanding of chemical bonding in solids and at illustrating the various applications that result. The functionality associated to molecular electronics is also covered based on an orbital and structural approach. | | | | | |
| Evaluation methods | Oral defense of a project with one or several guest international professors. | | | | | |
| Teaching methods | Classic or reverse class. | | | | | |
| Content | I. Point defects and non-stoichiometry : defect types, origin of intrinsic crystalline defects, point defects (Kröger- Vink notation), non-stoichiomety, extended defects. II. Electronic structure and electrical properties of solids : bonding in solids (band theory), relation between band structure and electronic properties, semi-conductors, electrical properties of some inorganic solids (MO | | | | | |
| | monoxides of the 3d series, transition metal sulfides MS2), ionic and molecular conductors. III. Magnetic properties of materials : basic concepts, molecular magnetism (long range ordering, elastic interactions, models), magnetism associated to conduction electrons, collective magnetism associated to ions (application to metal oxides). | | | | | |
| | paramagnetic resonance (EPR). Muon spin relaxation spectroscopy (MuSR). Neutron diffraction (structural aspects, spin density maps). X-ray magnetic circular dichroïsm (XMCD). | | | | | |
| | V. Various magnetic materials and applications : ferrites, garnets, hard and soft magnets, molecular magnets, spin crossover materials, photo-switches, photo-magnets and multifunctional hybrid inorganic-organic materials. | | | | | |
| | VI. Superconduting materials : metallic conductivity and superconductivity, review of superconductivity, BCS theory, superconducting oxides with a high critical temperature, applications of superconductors. | | | | | |
| | VII. Optical and dielectric properties of solids : inorganic lasers, cooperative dielectric properties (ferroelectricity, piezoelectricity). | | | | | |
