Igciv1032

Reinforced concrete structures

5.00 credits 30.0 h + 30.0 h Q2

Teacher(s)	Cap Jean-François ;					
Language :	French Louvain-la-Neuve					
Place of the course						
Prerequisites	This course requires a good knowledge of materials, strength of materials, mechanics of structures and stability constructions as taught in courses LGCIV1031, LGCIV1022, LGCIV1023.					
Main themes	See part 'Content' hereunder.					
Learning outcomes	At the end of this learning unit, the student is able to: With respect to the program's AA reference system, this course contributes to the development, acquisit and evaluation of the following learning outcomes: AA1.1, AA1.2, AA1.3, AA3.1, AA5.3, AA5.4 More specifically, at the end of this course, the student must have acquired a theoretical and practi knowledge of methods for calculating and designing structural elements in reinforced concrete. He/she should be able to design and calculate simple elements in reinforced concrete (beams, columns, by respecting the rules prescribed in the European standards in force (Eurocode 2) and to understa reinforcement and formwork plans. He will also master the fundamental concepts of the theory of reinforced concrete that will allow him address problems of designing more complex elements (slabs, shells, etc.).					
Evaluation methods	The exam covers the theoretical concepts seen in the course, as well as practical exercises. The details a specified during the course and described on Moodle.					
Teaching methods	Ex cathedra courses with slides. Workshop exercises.					
Content	Topics are discussed in the context of calculations in service (elastic behavior hypothesis) and rupture (plastic behavior hypothesis). The design methods presented refer to the rules prescribed in the current European standards (Eurocode 2). History of reinforced concrete Mechanical and physical properties of concrete Mechanical and physical properties of reinforcement steel Basic principles of calculation of reinforced concrete structures Structural safety and limit states Fundamental principles of bending calculation Behavior of a beam led to rupture by simple bending Elastic calculation and calculation at break of the sections subjected to the simple bending. Section subjected to a simple compression Sections subjected to the composite bending, elastic design and plastic design. Sections subjected to shear force Sections subject to torsion Shear forces at interfaces between 2 concrete zones Punching slabs Slender elements subjected to compression (buckling) Serviceability limit states: limitation of the stresses in service, limitation of the cracking, arrows. Plastic calculations by means of tie-rods Technological aspects of reinforcement of reinforced concrete elements
