UCLouvain

## Imeca2830

2024

## Aerospace dynamics.

5.00 credits	30.0 h + 30.0 h	Q1

Teacher(s)	Chatelain Philippe ;				
Language :	English > French-friendly				
Place of the course	Louvain-la-Neuve				
Main themes	<ul> <li>Universal gravitation and applications.</li> <li>Aircraft dynamics: equilibrium, stability and control.</li> <li>Launchers.</li> <li>Satellite orbits and attitude stability.</li> </ul>				
Learning outcomes	At the end of this learning unit, the student is able to:  In consideration of the reference table AA of the program "Masters degree in Mechanical Engineering", this course contributes to the development, to the acquisition and to the evaluation of the following experiences of learning:  • AA1.1, AA1.2, AA1.3 • AA2.1, AA2.2, AA2.3 • AA3.1, AA3.3 • AA5.1, AA5.2, AA5.4 • AA6.1, AA6.2  Introduce students to the specific issues of aircraft dynamics, launcher systems and dynamics, and satellite dynamics.				
Evaluation methods	Homeworks  The homeworks correspond to work that is mandatory and that must be performed during the quadrimester; each within a well-defined time period and with a given deadline for the report, that is graded.  The homework assignments are individual unless announced otherwise.  It is not possible to do, or even re-do, any of the work mentioned above outside of the time period that was defined for it within the quadrimester.  Final evaluation  The final evaluation is based on a written exam and homework report marks. A report must be produced for each within a specified time frame during the quadrimester and the marks are definitive (these assignments cannot be retaken). The exam is subdivided into 2 parts:  • theory  • practical exercises: performance, stability, control,  In case of technical issues or in case of fraud suspicion, the lecturers may reserve the right to replace the written exam by an oral exam.				
Teaching methods	Lectures  Combined use of a slides and virtual board  Slides and virtual board contents are provided to the students every other lecture at the latest  Course notes are available for the first part of the course: introduction and propellers; the second part (jet propulsion) is being worked on.				
Content	Aeronautics  • Aircraft performance: range, endurance, loads, • Aircraft static stability • Aircraft dynamics: summary of rigid body mechanics, • Special topics: glider performance flight and/or helicopter flight  Space  • Rocket propulsion • Launcher dynamics and staging optimisation. • Satellite dynamics: orbits, transfers, rendezvous, attitude stability.				

## Université catholique de Louvain - Aerospace dynamics. - en-cours-2024-lmeca2830

Inline resources	https://moodle.uclouvain.be/course/view.php?id=1538
Bibliography	<ul> <li>J.D. ANDERSON, Introduction to Flight</li> <li>B. ETKIN Dynamics of Flight - Stability and Control</li> <li>L. GEORGE, J-F VERNET, J-C WANNER La mécanique du vol</li> <li>J.W. CORNELISSE, H.F.R. SCHÖYER, K.F. WAKKER Rocket Propulsion and Spaceflight Dynamics</li> </ul>
Other infos	Programming skills in matlab or python are recommended
Faculty or entity in charge	MECA
