Structural and functional biochemistry

The version you're consulting is not final. This course description may change. The final version will be published on 1st June.

2.00 credits	20.0 h	Q1

Language :	French				
Place of the course	Louvain-la-Neuve				
Main themes	The course will be divided into two parts:1. Structural biochemistry:- patterns and forms in protein structures (observation, manipulation, description, classification)- principles of protein folding - domains and assemblies (modular nature of proteins, multi-protein complexes)- bioinformatics in structural biology-interactions between biomolecules (methods and characterization)2. Enzymology- principles of enzyme catalysis (Michaelis Menten, steady state kinetics, reaction schemes)- the basics of chemical catalysis by proteins (catalysis by amino acids lateral chains, active site complementarity, entropic catalysis, transition state stabilisation)- control of enzyme activity (inhibition, activation, cooperativity, allosterism, environmental effects)				
Learning outcomes					
Evaluation methods	The course is divided into three modules. Each module will be evaluated during the course of the quadrimester in the form of a dispensatory test. Exemption is awarded at 12/20.				
	A written exam will be organized in session for students who have not passed the tests during the quadrimester. Practical courses are mandatory. Report on practical courses is mandatory.				
Teaching methods	Ex cathedra lectures				
Content	About 36 hours will be dedicated to lectures with the help of PowerPoint slides. 6 hours will be organized in computer room for exercises or guided tours of various websites. The course is composed of three main chapters:				
	Chapter 1. Amino acids side chains: - hydrophobicity/hydrophilicity - electrostatic and acido-basic properties - nucleophilicity - redox properties. Structural biochemistry: - biomolecule structures and interactions: non covalent driving forces and quantitative aspects - thermodynamical and chemical stability of proteins - protein folding: from molecular mechanisms to conformational diseases - observation, manipulation, visualisation, description and classification of three-dimensional structures (in computer room)				
	Chapter 2: structural biology of membrane proteins Chapter 3. Enzymology - principles of enzyme catalysis (Michaelis Menten, steady state kinetics, reaction schemes) - the basics of chemical catalysis by proteins (catalysis by amino acids lateral chains, active site complementarity, entropic catalysis, transition state stabilisation) - cofactors and coenzymes chemistries - control of enzyme activity (inhibition, activation, cooperativity, allosterism, environmental effects) - numerical simulation of enzymatic catalysis (in computer room)				
Inline resources	All documents are available via Moodle				
Other infos	Precursory courses: Basics in biochemistry (e.g. Elements of biochemistry CHM1271)				
Faculty or entity in charge	BIOL
