

The version you're consulting is not final. This course description may change. The final version will be published on 1st June.

5.00 credits

30.0 h + 30.0 h

Q2

Teacher(s)	. SOMEBODY ;Fisette Paul ;Oestges Claude ;
Language :	French
Place of the course	Louvain-la-Neuve
Prerequisites	This course supposes acquired the notions of physics and mathematics such as taught in <b>LEPL1201, LEPL1101 and LEPL1102.</b>
Main themes	Two themes are considered : <ul style="list-style-type: none"> <li>• The first theme deals with electromagnetism, in particular in materials, it is the continuation of LEPL1201.</li> <li>• The second theme introduces the dynamic of the rigid body in 3D.</li> </ul>
Learning outcomes	<p><b>At the end of this learning unit, the student is able to :</b></p> <p><b>Contribution of the course to the program objectives:</b> Regarding the learning outcomes of the program of Bachelor in Engineering Sciences, this course contributes to the development and the acquisition of the following learning outcomes:</p> <ul style="list-style-type: none"> <li>• LO 1.1, 1.2</li> <li>• LO 3.2</li> <li>• LO 4.1, 4.4, 4.5</li> </ul> <p><b>Specific learning outcomes of the course:</b> The learning outcomes marked by (*) are initiated in LFSAB1202 and applied for FSA11BA students, in the framework of the project LFSAB1502. At the end of the course, he student will be able :</p> <p>1. for the part on electricity: LO 1.1, LO 1.2: to use basic law of electromagnetism to solve simple problems in electromagnetism or electromechanics and more specifically, will be able to:</p> <ul style="list-style-type: none"> <li>• Use vector formalism to express interaction forces, in vacuum, between a magnetic field and moving particles or a current, or between currents.</li> <li>• Use Biot-Savart and Ampere laws in vacuum to calculate the magnetic field produced by currents travelling in geometrically simple structures. (*)</li> <li>• Calculate the trajectory of a charged particle through a uniform and constant magnetic field</li> <li>• Distinguish the magnetic properties of various materials (dia-,para-,ferro-magnetic) based on their magnetic permeability. (*)</li> <li>• Explain and interpret the effect on a coil inductance when a ferromagnetic core is introduced(*)</li> <li>• Explain the hysteresis phenomenon of magnetic materials, and use the magnetic permeability in the derivation of inductances or simple magnetic circuits containing linear or non-linear magnetic materials. (*)</li> <li>• Explain the origin of energy losses in a conducting or ferromagnetic material for AC regime</li> <li>• Explain and justify the boundary conditions for B and H at the interface between two different media</li> <li>• Define the inductance and mutual inductance of simple structures with and without a ferromagnetic core(*)</li> <li>• Explain the Lenz-Faraday law expressing the e.f.m induced by a variable magnetic flux and use it for the calculation of AC generators with geometrically simple structures(*)</li> <li>• Calculate the magnetic energy stored in simple circuits or structures</li> <li>• Explain how simple electromechanical systems like a DC motor, a AC generator, an ideal transformer, an electromagnet work by exploiting the notion of magnetic flux</li> <li>• Write and explain Maxwell equations for the EM field in their integral formulation limited to the static case</li> </ul> <p>2. for the part on mechanics of the rigid body: LO 1.1, LO 1.2 to express in vector form the equations of motion of one or several interconnected rigid bodies; to derive the equations describing the dynamics of a single rigid body (Newton-Euler equations); to manipulate generalized coordinates to model multiple rigid bodies dynamics (by means of) and to derive their equations of motion as well as the constraint forces via the Virtual Power Principle.</p>

	<p>and more specifically, will be able to:</p> <ul style="list-style-type: none"> <li>• use the tools associated to the geometrical space allowing to manipulate vectors in the 3D space</li> <li>• Use the systematic procedure to calculate, in a general frame, the successive temporal derivatives of a vector in a mobile base.</li> <li>• Describe in the 3D space, the instantaneous configurations of one or several interconnected rigid bodies</li> <li>• Specify the variables describing the dynamic behavior of a body modeled as a continuous medium (mass center, momentum, angular momentum, kinetic energy) with an application to the rigid body case</li> <li>• Use and manipulate the concept of the inertial matrix of a rigid body to mathematically express its angular momentum and kinetic energy</li> <li>• Exploit various properties (symmetry, planes figures, ...) to easily derive the mass center position as well as the inertial matrix of a geometrically simple body or combination of various geometrically simple bodies</li> <li>• express the vector motion equations of a rigid body submitted to various forces (Newton-Euler equations)</li> <li>• For a rigid body first, then for a system of interconnected rigid bodies, make a justified choice of a set of generalized coordinates allowing an optimized description of the configurations of the system (in 3D /2D space)</li> <li>• For a rigid body first, then for a system of interconnected rigid bodies, express the constraints ' holonomic and non-holonomic ' involving the generalized coordinates (or velocities), and verify their independence</li> <li>• Determine the number of degrees of freedom of a mechanical system</li> <li>• Make the inventory of forces (and torques) influencing the dynamic behavior of such a system</li> <li>• Write the motion equations for such a system as a function of generalized coordinates and their derivatives</li> <li>• Make use of the virtual power principle to derive the differential equations describing the behavior of rigid systems, avoiding the calculation of link forces</li> <li>• Explain the various kinds of links or static supports, and related degrees of freedom and constraints</li> </ul>
<p>Evaluation methods</p>	<p>Students are evaluated individually (writing exam during the session):</p> <ul style="list-style-type: none"> <li>• the "electromagnetism" part counts for 40% of the final grade;</li> <li>• the "rigid body mechanics" part counts for 60% of the final grade,</li> </ul> <p>unless one part is graded below 10/20 (for grading details in this case, see the French version of this note)</p> <p>An optional test on the "electromagnetism" part is (normally) organized during the semester, and counts for 30% of the grade of the "electromagnetism" part, if it is to the advantage of the student.</p> <p>For the the written examination, only an unannotated form, provided to the students at the beginning of the year, is allowed.</p>
<p>Teaching methods</p>	<p>The course is organized</p> <ul style="list-style-type: none"> <li>• around problem-based learning sessions, or experimental laboratory work, which predate the lectures;</li> <li>• around exercise-based learning sessions, that follow lectures;</li> <li>• around lectures including from time to time 'live' experiments' in physics.</li> </ul>
<p>Content</p>	<p><b>Electromagnetism</b></p> <ul style="list-style-type: none"> <li>• Magnetostatics in vacuum and materials</li> <li>• Magnetic induction</li> <li>• Inductance and magnetic circuits</li> </ul> <p><b>Rigid body mechanics</b></p> <ul style="list-style-type: none"> <li>• Vector geometry and 3C kinematics</li> <li>• Dynamics characterization of a rigid body</li> <li>• Dynamics of rigid bodies</li> <li>• Static of rigid bodies</li> </ul>
