

5.00 credits

45.0 h + 15.0 h

Q1

Teacher(s)	Fustin Charles-André ;Gohy Jean-François ;Jonas Alain ;
Language :	English > French-friendly
Place of the course	Louvain-la-Neuve
Prerequisites	This course requires a previous basic knowledge of the physics and chemistry of polymers, as given in the introductory courses LCHM1361 or LMAPR2019, e.g.
Main themes	This course provides an introduction to advanced methods of polymerization and to the characterization of macromolecules in solution. The course is made of flipped classrooms and projects. All topics are not necessarily covered each year. Part A: After recalling the basics of chain polymerization methods, the different current synthetic strategies will be studied (anionic, cationic, standard radical, controlled radical and coordinative polymerization methods). The scope and limitations of each method will be systematically discussed. Mechanistic and kinetic features will be then studied for each polymerization method. Special emphasis will be finally placed on the control of macromolecular architectures. Part B discusses the notions of ideal and real chains, the size of macromolecules in solution, the notions of excluded volume and second virial coefficient, the thermodynamic properties of polymer solutions, and different techniques of characterization of polymers in solution (osmometry, viscometry, size exclusion chromatography, static light scattering).
Learning outcomes	At the end of this learning unit, the student is able to : The course aims at providing a deep knowledge of chain growth polymerization methods, as well as of polymer solutions. The contribution of this Teaching Unit to the development and command of the skills and learning outcomes of the programme(s) can be accessed at the end of this sheet, in the section entitled "Programmes/courses offering this Teaching Unit". At the end of part A, the students will master the state-of-the-art in chain growth polymerization methods, the links between controlled and living polymerization methods and the molecular characteristics of the resulting chains (molar mass, chain dispersity, architecture), and the technological gridlocks facing chain growth polymerization. Additionally, the students will be able to use the above-mentioned concepts in order to propose relevant synthetic methods for specific cases. At the end of part B, the students will be able to analyze results from experimental methods of determination of the molecular characteristics of a polymer (molar mass, distribution of molar mass, radius of gyration), and to predict its behavior in solution (solubility, swelling, second virial coefficient, interaction parameter, phase separation). They will also be capable to solve small problems of practical relevance in the field of polymer engineering using these and complementary notions.

Evaluation methods	The two parts have the same weight in the final grade, which is the arithmetic mean between the grades obtained for each part. Part A "Chain polymerization methods" (3 credits) Part (50%) for the work performed during the year (continuous evaluation) and part (50%) for the written exam. The written exam consists of solving cases similar to those studied during the course. The final grade is rounded to the nearest integer. The use of generative artificial intelligence for the production of (parts of) deliverables is allowed, provided this use be indicated to the teachers, done in a critical way, and compared to other sources. Part B "Physical chemistry of polymers in solution" (2 credits) Part of the marks (x1, max. 20) will be awarded for answers to quizzes prepared for flipped classes and to the unprepared questions asked in the class. The use of generative AI's is allowed for the preparation, but not during the class and the presentation of answers to questions. Part of the marks will be awarded based on answers to the written exam (x2, max. 20). The final note is $\max(0.4 \times 1 + 0.6 \times 2; \times 2)$, rounded to the nearest integer number, unless the score falls between 9 and 10, in which case it is rounded down to the nearest whole number. The x1 mark for the continuous evaluation is the sum of the grades obtained for each class at which the student was present; absence to a class does not result in a grade. The mark obtained for a given class is the sum of the grades given for the answers provided by the randomly-drawn students; it is a collective mark. The exam is without connection to internet, but with the syllabus or slides given by the teachers; the student is allowed to write in these documents (own writing, no free sheets). The exam asks thinking questions, small problems, etc. Failure to comply with methodological guidelines, particularly with regard to the use of online resources, generative AI, or collaboration between students, for any part of the continuous assessment will result in an overall score of 0 for the continuous assessment.
Teaching methods	Part A "Chain polymerization methods" The chemistry part is based on a self-learning system. Scientific reviews, dealing with the main polymerization methods, will be provided and will be analyzed in small groups. Each student will work on three projects (polymerization methods). The self-learning will be conducted for two to three weeks during which the students and teachers will meet to discuss the reviews and prepare a presentation summarizing the reviews (see schedule). The students will then present orally their project before the whole class, followed by questions. This self-learning process will be evaluated by the teachers. Part B "Physical chemistry of polymers in solution" The physical chemistry part is made of a limited number of classes in flipped classroom format, in which the students resolve small problems and discuss concepts with the teacher, based on a prior reading of a section of the lecture notes and/or on watching podcasts. Before each class, the students have to prepare 3-4 questions on their preparative reading (quizzes); the teacher randomly selects students during the class and asks them to present their proposition of answer at the blackboard. A non-prepared question is also asked at the end of each class to all students.
Content	Part A "Chain polymerization methods" 1. Introduction: Living and controlled chain polymerizations 2. Atom-transfer radical polymerizations (ATRP) 3. Nitroxide-mediated radical polymerizations (NMP) 4. Reversible addition-fragmentation chain-transfer polymerizations (RAFT) 5. Anionic polymerizations 6. Living ring-opening polymerizations (LROP). 7. Organocatalytic ring-opening polymerizations 8. Control of macromolecular architectures 9. Mechanistic transformations 10. Supramolecular polymerizations At the end of the course, the students will be able to propose a valid synthetic method to prepare a (co)polymer with given molecular characteristics (chemical composition, architecture, chain length,...). Part B "Physical chemistry of polymers in solution" 1. Distributions of molar mass and chain configurations - reminders 2. Models and size of chains in theta solvents 3. Solvent quality and swelling of macromolecular chains in solution 4. Viscometry, dynamic light scattering and size exclusion chromatography 5. Phase diagrams of polymer solutions 6. Solubility parameters 7. Osmometry of macromolecular solutions 8. Static light scattering by macromolecular solutions At the end of the course, the students will be able to analyze results from experimental methods of determination of the molecular characteristics of a polymer, and to predict its behaviour in dilute solution.
Inline resources	Part A "Chain polymerization methods" Review papers and presentations made by the students will be made available on the website of the course. Part B "Physical chemistry of polymers in solution" Lecture notes, podcasts and experimental data will be available on the Moodle website of the course.

Bibliography	L'ouvrage de référence suivant couvre <i>une partie</i> des concepts du partim B / the following textbook deals with <i>part</i> of the concepts of part B: Paul C. Hiemenz & Timothy P. Lodge, Polymer Chemistry, 2nd edition, CRC Press:Boca Raton, 2007. Cet ouvrage n'est pas indispensable pour la participation au cours. This book is not required for the course.
